

<b>Time</b>	~ 1 day
<b>Learning Goals</b>	<ul style="list-style-type: none"><li>• Write unit tests for your PairBnB app</li><li>• Write features tests for your PairBnb app</li></ul>

## Objectives

Now that we are armed with all the arsenals necessary to write tests, it's time to write tests for your PairBnB app. For this exercise, let's focus on reservations and the pagination for your listings.

For your reservations,

- Write at least 1 model spec for the most complicated instance method. For example, the method that you wrote to check for overlapping bookings.
- Write controller specs.
- Write feature specs. For example, what do you expect to happen after a user clicks on "Make Reservation/Booking" (it may be called something else in your app).

For your pagination feature, make sure the user experience is correct. This means:

1. It should display the correct number of pages.
2. The correct page should be marked as active.
3. If a user is on the first or last page, the previous or next links should be disabled (respectively).

TDD this feature using Capybara.
