

Time	~ 1 day
Learning Goals	<ul style="list-style-type: none"> • Write relevant methods in a model • Understand single class responsibilities

Now that we've built our **user** and **listing** stories, let's proceed to build the user stories for reservations. To recap:

- A **user** can make many **reservations** for many **listings**
- A **user** can view the **reservations** they have made, or the **reservations** made for their **listing**

Let's ignore payments for now. Assume all reservations are free!

Reservation Flow

Try to simulate AirBnB's reservation flow, e.g. a **user** can enter a date range which will list available properties on those dates. A **user** can subsequently book those properties via an **instant confirmation** method. Look out for overlapping bookings! For the filtering, keep it simple for now - a user can search properties in a particular **city**. You could incorporate **city** search as a simple select dropdown for now.

Feel free to spruce up your front-end along the way. For example, you may want to incorporate a pretty [datepicker](#) that gives you a decent-looking calendar for users to easily select their booking dates.
