Alrightey! You have setup a Rails app before in the [URL shortener challenge](). Let's do it one more time for your PairBnB app!

Your tasks are:

1. Create a new Rails repository for your PairBnB **using PostgreSQL database**.
2. Create your very own Github repository for hosting PairBnB code.
3. Commit small and commit often.
4. Have mentor review your work before progress.

IMPORTANT NOTE: Ensure you provide a good description since PairBnB app will be your portfolio on Github.

Discussion

At this point, you should discuss with experienced coders like your mentor about:

1. Why should we commit small and often?
2. Is the GitHub remote repository really necessary?
3. Are there any other database besides PostgreSQL and Sqlite3?
